Net taxes on products

In January-September 2022, the GDP deflator index amounted to 113.9% compared to prices in January-September 2021. The highest values of deflator indices in the context of industries were noted in industry - 114.8%, construction - 114.8% and other service industries - 118.8%.

Deflator indices are lower than, in general, for the economy (113.9%), were observed in trade, accommodation and food services - 112.8%, agriculture, forestry and fisheries - 108.5%, transportation and storage, information and communication - 103.9%.

At the same time, the deflator index of net taxes on products amounted to 123.2%.

For information: The consumer price index (CPI) in Uzbekistan for January-September 2022 compared to January-September 2021 reached 111.2%, while the CPI for goods amounted to 112.5%, for services - 106.7%.

During the period under review, compared with January-September 2021, food prices increased by 14.9%, non-food products - by 9.7%.

Explanation of statistics

Gross domestic product (GDP) – one of the most important indicators of the System of National Accounts (SNA), characterizing the final result of the production activity of resident economic units, which is measured by the value of goods and services produced by these units for final use.

Gross Regional Product (GRP) in terms of its economic content, it is a close regional analogue of the GDP indicator and characterizes the final result of the production activity of institutional units - residents located in the economic territory of the region, for a certain period of time.

GDP (GRP) per capita is determined by dividing the total GDP (GRP) at current prices by the average population of the country (region) for a certain period of time.

Gross value added (GVA) is defined as the difference between the value of goods and services produced (output) and the value of goods and services fully consumed in the production process (intermediate consumption).

Product taxes are taxes generally levied on a per unit basis of a good or service, i.e. in proportion to the quantity or value of the goods and services produced, sold or imported by residents. These include value added tax, excises, export and import taxes, etc.

Product subsidies are subsidies paid from the state budget per unit of goods or services, i.e. in proportion to the quantity or value of goods and services produced, sold or imported by residents.

Net taxes on products are taxes on products less subsidies on products.

The index of physical volume (real growth rates) of GDP is calculated as the ratio of the GDP of the reporting period, calculated at constant prices, i.e. in prices of the corresponding period of the previous year (real GDP) to GDP in current prices of the corresponding period of the previous year.

The GDP deflator index characterizes the average change in prices in the economy and is calculated as the ratio of nominal GDP (GDP of the reporting period at current prices) to real GDP.
